☀ We found living things in "Kudoji" ☀

表

① Japanese name: 「Yama aka gaeru」

• Distribution: 「Honshu, Shikoku, Kyushu」
「Sado Island」

• length : 4.2cm ~ 7.8cm

• explanation : They live in hill territory,
mountains and forests.

② Japanese name: 「O zetto tonbo」

• Distribution: 「Tohoku」

• length : about 4cm

• explanation : They live in the
mountainous regions
in a pond, a marsh,
a stream.

(The last of May
~ the middle of August)

③ Japanese name: 「Tonosama gaeru」

• Distribution: 「Honshu (Remove from
"Kanto" to the "sendai"
plain(s)), 「Shikoku,
「Kyushu」

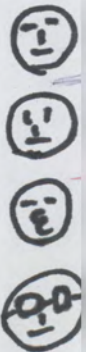

• length : ♂ 3.8cm ~ 8.1cm
♀ 6.3cm ~ 9.4cm

• explanation : Fundamentally, they live
in a paddy field. But
they live pretty far away
place from a paddy field.
(Except in breeding season
↳ April ~ June)

④ explanation: 「Oniyama's slough」

explanation: Larvae have a big and strong
body. The body's color is
dark brown. They have two
black lines on the center of
the abdomen and back.

Experiment's procedure 😊

- We went to Kudoji in June.
- We actually caught a living thing to take a picture.

Experiment's result 😊

- We could not catch any living things because we had no time.

But, we could see living things near the water.

Consideration, Conclusion 😊

We found that there are a lot of frog eggs and tadpoles in early summer.

If we look for insect in another season we may be able to find a lot of insect.

This time we caught a lot of male dragonfly.

Next time we want to look for female dragonfly and catch it.

Purpose 😊

- We want to find some rare organisms.
- There is quite a difference between the environment of Kudoji and the city live in.

Because we think there are various riparian organisms.

Method 😊

- We went to Kudoji, found the organisms, took a picture of them and researched them.
