Purpose

Let's save the beech tree in Shirakami Mountains.

Reason

Because the virgin forest of beech trees in Shirakami Mountains decreased sharply and rapidly.

Problem

How can we stop global warming and how should we live?

Learn about beech

- Beech's lifespan is about 250 years.
 - In 1993, The Shirakami Mountains were registered as a world heritage site.
- Because it is a large area without the influence of humans.

Trivia

- Beech seeds have 7 kilocal.
- 30% of beech seeds are made of fat.
- Humans need 2400 kilocal a day. We must eat 300 ~ 400 seeds.

Crisis of beech

We made full use of industrialization and lived life wealthy.

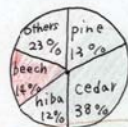

However, trees were felled, and the depletion of the ozone layer by toxic gas happened. Beech trees can't be distributed over the Shirakami Mountains when global warming advances.

Improvement plan

- We don't get plastic bags in supermarkets.
- We should bring eco bags.
- We must make an environment that children are interested in naturally.

The stored rate of each kind of tree

diagram 2

Aomori

Beech trees make up approximately 14% of trees in Aomori. If these trees decrease, what will happen to Aomori?

Suggestion

- We should plant trees regularly.
- We should teach knowledge of nature.
- Make beech trees become the raw materials of various products.

World from members

Should we end the history of the Shirakami Mountains which has existed for more than 800 years by our actions?
