

Use ground water for melting snow

Advantages

- Cost is cheap
- Less Carbon dioxide emissions

Disadvantages

- If we don't have ground water, We can't melt snow.
- It needs a lot of maintenance.

Conclusion

We learned about geothermal generation systems and renewable energy. These systems are useful to our life. Through these activities, we want to think about how to make energy and how to use it.

Geothermal Power Generation & Renewable Energy

members

Hirosaki Minami High School

Motive

According to our teacher, Japan can't make a lot of energy. so we thought we could check for other types of renewable energy.

Plan

We researched about geothermal power generation and renewable energy on the Internet.

Geothermal power

"Eco R system" is a very popular snow melting system now. It uses ground water to melt snow and ice. It is the new snow melting system.

Biomass power

We will explain how to generate biomass power. First, The Tsugaru Biomass Energy Company makes wood chips from forest trees, which are then burned in a burner. Their energy is used in many public facilities.
